3 Description	Circuit Diagram
<p>The GT852X, GT8521, GT8522 and GT8524, family of precision amplifiers offers state-of-the-art performance. With chopper stabilized technique, the GT852X offset voltage and offset drift provide unparalleled long-term stability. With a mere 21 <math>\mu\text{A}</math> of quiescent current, the GT852X are able to achieve a 350KHz bandwidth. These small-size, high-precision operational amplifiers have high input impedance and rail-to-rail input and rail-to-rail output swing. The GT852X feature flat bias current over temperature. Therefore, no calibration is needed in high input impedance applications over temperature.</p> <p>All versions are specified over the temperature range of <math>-40^\circ\text{C}</math> to <math>+125^\circ\text{C}</math>.</p>

## 6 Voltage, Temperature, ESD and Thermal Ratings

### 6.1 Absolute Maximum Ratings

Parameters	Min	Max	Unit
Supply Voltage ,Vs=(V+)-(V-)		6.5	V
Select Input Voltage	(V-)-0.5	(V+)+0.5	V
Maximum Junction Temperature	-55	150	°C
Storage Temperature Range	-55	150	°C

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.3V beyond the supply rails should be current-limited to 10mA or less.

### 6.2 ESD Ratings

ESD		Value	Unit
V(ESD)	Electrostatic discharge	Human-Body Model (HBM)	6 K
		Charged-Device Model (CDM)	2 K

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

Symbol	Parameter	Min	Max	Unit
V <sub>CC</sub>	Single-supply ,Vs=(V+)-(V-)	1.8	5.5	V
V <sub>CC</sub>	Dual-supply ,Vs=(V+)-(V-)	±0.9	±2.75	V
TA	Operating temperature	-40	125	°C

### 6.4 Thermal Information

Package Type	$\theta_{JA}$	$\theta_{JC}$	Unit

## **9 Detailed Description**

### **9.1 Overview**

The GT852X family of zero-drift amplifiers is engineered with state-of-the-art, proprietary, precision zero-drift technology. These amplifiers offer ultra-low input offset voltage and drift, and achieve excellent input and output dynamic linearity. The GT852X operate from 1.8 V to 5.5 V, are unity-gain stable, and are designed for a wide range of general-purpose and precision applications.

### **9.2 Feature Description**

The GT8521, GT8522, GT8524 series op amplifiers operate over a power-supply range of +1.8 V to +5.5V ( $\pm 0.9V$  to  $\pm 2.75V$ ). Supply voltages higher than 6.5 V (absolute maximum) can permanently damage the amplifier. Parameters that vary over supply voltage or temperature are shown in the Typical Characteristics section of this data sheet.

## 10 Application Note

The GT8521, GT8522, GT8524 series op amps are unity-gain stable and free from unexpected output phase reversal. They use chopper stabilized techniques to provide low offset voltage and very low drift over time and temperature. Good layout practice mandates use of a  $0.1\mu\text{F}$  capacitor placed closely across the supply pins.

For lowest offset voltage and precision performance, circuit layout and mechanical conditions should be optimized. Avoid temperature gradients that create thermoelectric (Seebeck) effects in thermocouple junctions formed from connecting dissimilar conductors. These thermally-generated potentials can be made to cancel by assuring that they are equal on both input terminals.

Fig.10-1. shows the GT852X in a Bi-Directional Current Sense Amplifier.
